Content and Liability Disclaimer

The information in this publication was considered technically sound by the consensus of persons engaged in the development and approval of the document at the time it was developed. Consensus does not necessarily mean that there is unanimous agreement among every person participating in the development of this document.

AASHTO and ITE standards and guideline publications, of which the document contained herein is one, are developed through a voluntary consensus standards development process. This process brings together volunteers and/or seeks out the views of persons who have an interest in the topic covered by this publication. While AASHTO and ITE administer the process and establish rules to promote fairness in the development of consensus, they do not write the document and they do not independently test, evaluate, or verify the accuracy or completeness of any information or the soundness of any judgments contained in their standards and guideline publications.

AASHTO or ITE disclaim liability for any personal injury, property, or other damages of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, application, or reliance on this document. AASHTO and ITE disclaim and make no guaranty or warranty, express or implied, as to the accuracy or completeness of any information published herein, and disclaims and makes no warranty that the information in this document will fulfill any of your particular purposes or needs. AASHTO and ITE do not undertake to guarantee the performance of any individual manufacturer or seller's products or services by virtue of this standard or guide.

In publishing and making this document available, AASHTO or ITE are not undertaking to render professional or other services for or on behalf of any person or entity, nor are they undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances. Information and other standards on the topic covered by this publication may be available from other sources, which the user may wish to consult for additional views or information not covered by this publication.

AASHTO and ITE have no power, nor do they undertake to police or enforce compliance with the contents of this document. AASHTO and ITE do not certify, test, or inspect products, designs, or installations for safety or health purposes. Any certification or other statement of compliance with any health or safety-related information in this document shall not be attributable to AASHTO or ITE and is solely the responsibility of the certifier or maker of the statement.

Acknowledgements

This document was produced under contract to the Institute of Transportation Engineers (ITE), which, with the American Association of State Highway and Transportation Officials (AASHTO), is working under a **cooperative agreement** with the Federal Highway Administration (FHWA). The ITS Joint Program Office (JPO) of Research and Innovative Administration (RITA) provided oversight and program management for the US Department of Transportation (USDOT). The Traffic Management Data Dictionary (TMDD) Steering Committee and a special review subcommittee provided technical oversight of this development.

The project team responsible for the development of this document included the following company:

- Consensus Systems Technologies (ConSysTec)

The TMDD Steering Committee also received input and review from the following groups during the development of TMDD Version 3.0 (TMDD v3.0):

- IEEE 1512 Incident Management Working Group
- National Transportation Communications for ITS Protocol (NTCIP)
- Society of Automotive Engineers (SAE)

TMDD Steering Committee

At the time that this document was prepared, the following individuals were members of the TMDD Steering Committee:

- | | |
|------------------------------------|--------------------------------------|
| • Morgan Balogh, WSDOT | • Raman Patel, RK Patel & Associates |
| • Tom Batz, TRANSCOM | • Robert Rausch (Chair), TransCore |
| • Steve Dellenback, SWRI | • Edward Seymour, TTI |
| • Israel Anthony Lopez, Nevada DOT | • Mike Jenkinson, CalTrans |
| • Glenn Massarano, Siemens ITS | • Peter Thompson, SANDAG |
| • Greg Mizell, Econolite | • Kenneth Vaughn, Trevilon |

Additional Contributors and Reviewers

In addition to the TMDD Steering Committee, there were many others that contributed to the development of this standard and their input and assistance was critical to the final product. The following list includes those volunteers and others who gave their time to help both the consultant and the committee ensure that the resulting standard met their needs. Of particular interest were participation by representatives of LA County and LA DOT which provided extensive input regarding data exchanges for cooperative traffic control of surface streets. In addition to this arena, the new version of the TMDD has been expanded to support exchanges regarding roadway weather and archived data user services.

Finally, the committee acknowledges the assistance and input provided by the FHWA western Resource center by Edward Fok and the guidance and assistance received from Noblis by Blake Christie and Jeris White.

The following is a more complete list of those who volunteered their time and travel to contribute to the input and review during the development of this standard:

Foreword

The two volumes of this information level standard publication define a high level Concept of Operations and Requirements (Volume I) and Design Concepts (Volume II) for exchanging information between traffic management centers (TMCs) and other external centers (EC). The material provided by this document is used to develop a communications *System Interface* (SI) for center-to-center (C2C) information exchange.

For more information about AASHTO standards, visit the AASHTO Web site at www.aashto.org. For a hardcopy summary of AASHTO information, contact the AASHTO coordinator at the address below.

For more information about ITE standards, visit the ITE Web site at www.ite.org. For a hardcopy summary of ITE information, contact the ITE coordinator at the address below.

In preparation of this document, input of users and other interested parties was sought and evaluated. Inquires, comments and proposed or recommended revisions should be submitted to:

History

A summary of the changes in TMDD v3.03, v3.02 and v3.01 from TMDD v3.0 can be found in Volume I.

Introduction

This publication is a maintenance update of TMDD V3.0, published on November 12, 2008. This maintenance update adds performance requirements to the standard, addresses several comments received on the standard, and corrects several errors that were found in the traceability tables.

The previous maintenance update, v3.03c includes changes to the traceability matrices to improve its usability and reduce ambiguities, adds a section on performance requirements, addresses comments received, and corrects several errors that were found in the traceability tables.

Maintenance update, v3.02, adds support for sharing hazmat-incident related information to close a gap that is critical to national and regional security. Maintenance update v3.01 corrected errors that were discovered by implementing TMDD V3.0, clarifies some ambiguities that were encountered, reorganizes user needs and requirements to better support interoperability, and includes some changes in the Requirements Traceability Matrix (RTM) to clarify traceability. The document has been given a new title that reflects the intent and the content.

This document provides the foundation of the Center-to-Center (C2C) Concept of Operations and Requirements for Advanced Traffic Management System (ATMS). It should be noted that the ATMS is a very complex system and there are many other standards that are necessary for development and C2C operations. This document, however addresses the most fundamental elements of an ATMS.

This document is intended primarily for the following audience:

- Transportation operations managers
- Transportation operations personnel
- Transportation engineers
- Transportation management procurement officers
- System integrators
- Device manufacturers

C2C communications can be used to:

- Provide event information to other centers;
- Provide traffic and travel data to other centers;
- Help coordinate operations within the defined C2C network; and
- Provide remote control of traffic control devices.

The C2C environment is operationally diverse. All of the systems that exchange information do not serve the same functions but do use the Traffic Management Data Dictionary (TMDD) Standard for Center-to-Center Communications, hereafter referred to as the TMDD, for data exchanges among centers. Even systems with the same functions may not operate identically. This diversity requires both a flexible approach to the required content in each data exchange and a rigorous definition of the data being exchanged.

The C2C environment is sparsely deployed. There have been few large integrated regional deployments, so operational experience is available only from a few sites. The

time to fully deploy a regional or statewide system may be lengthy, covering five years or more. The overall approach to standards needs to support the replacement of nearly all C2C software over time.

The ITS standards development process uses a systems engineering process that requires a Concept of Operations (ConOps) document to define user needs. Further, the established system engineering process states that requirements must only be developed for those functions or operations for which a need has been established.

The ConOps and Requirements stage in this process is to identify and operationally describe the ways in which the system will be used. In the case of this document, this entails identifying the various ways in which those addressed above may use C2C connections to other centers to fulfill their duties. This ConOps and Requirements provides the reader with:

1. A detailed description of the scope of this standard;
2. An explanation of what operations the C2C connections provide;
3. A starting point in the procurement process; and
4. An understanding of the perspective of the designers of the standard.

The ConOps and Requirements are independent of the underlying C2C protocols, such as DATEX (DATA EXchange), XML (eXtensible Markup Language), or other. The protocols are transparent to the system operators and no references to the specific features provided by an underlying protocol are part of the ConOps.

The design stage of the systems engineering process specifies a solution based on the requirements. The design contains definitions of TMDD data concepts (dialogs, messages, data frames, data elements and object classes) written in ISO 14817 compliant Abstract Syntax Notation (ASN.1) and in XML schema.

Contents

1	Document Introduction	1
1.1	Purpose.....	1

TMDDv3.03c-Vol2.doc		07/16/14	P. Chan	Approved Standard. Updated cover page and date.

1 Document Introduction

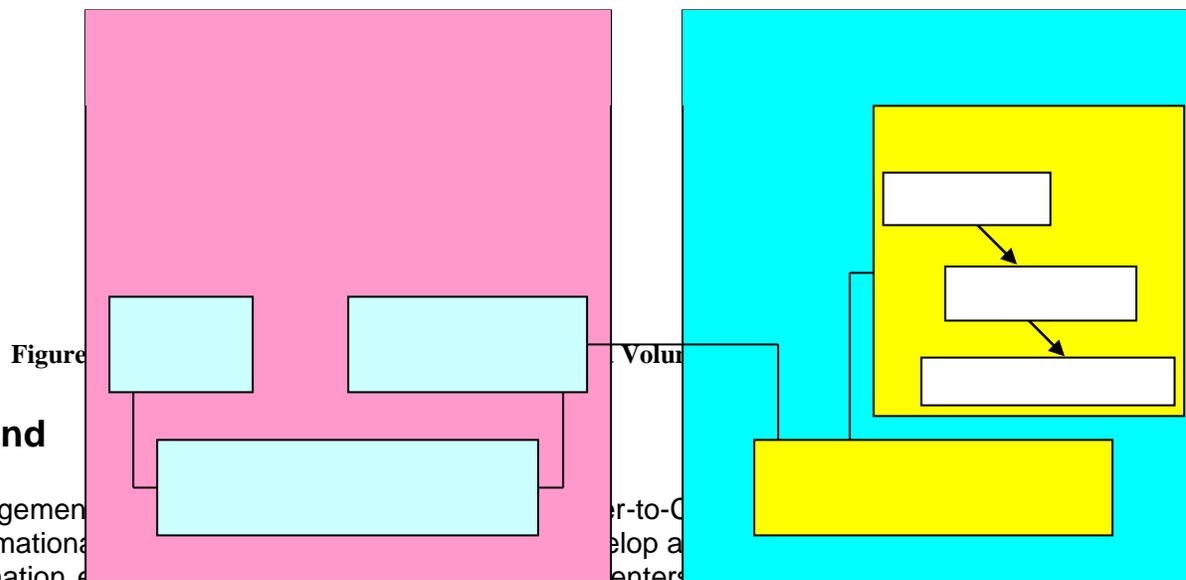

1.1 Purpose

The purpose of the TMDD Standard for Traffic Management Center-to-Center Communications Volume I document is to identify and describe the needs and requirements for a traffic management center (TMC) to provide services to external centers (EC) via a communications interface.

This document defines the user needs that are addressed by the standard and the functional requirements that are met by the design content. Volume I also addresses topics related to the use of the standard such as:

- Conformance to the standard;
- Extensions to the standard; and
- Backwards compatibility of this version of the standard with previous versions.

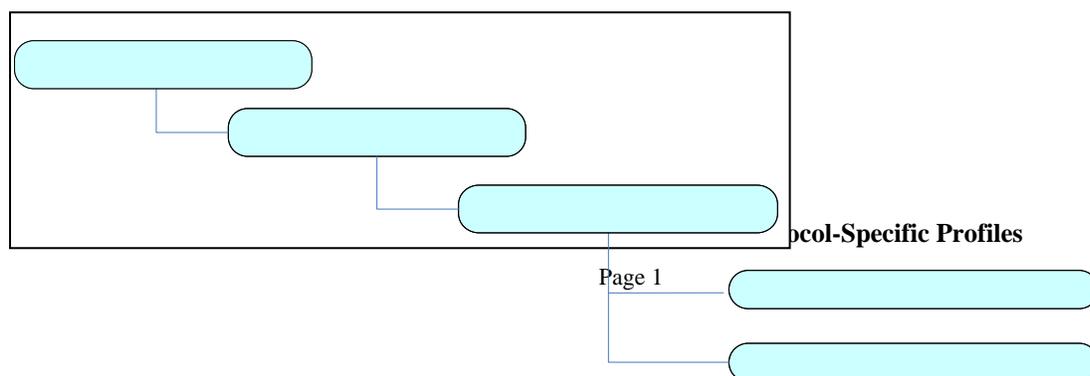

The design content for the TMDD, which includes dialogs, message sets, data frames and data elements, is provided in the companion Volume II: Design Content. The two volumes together make up the TMDD Standard. Figure 1 depicts the relationship between the volumes in the document.

1.2 Background

The Traffic Management Center-to-Center Communications (TMDD) is an information interface for information exchange between a center and other centers. Using an object-oriented based set of data concepts, the TMDD standard provides a protocol-independent, high-level definition of how the services will be provided via a systems interface (SI). There are a variety of protocol-specific application profiles that define the details of how to implement the interface.

Figure 2 depicts the relationship between the TMDD standard and the protocol-specific application profiles. Note that the use of one of these application profiles is necessary to implement TMDD-based system interface.

This layered approach to the TMDD was developed due to the variety of existing TMC implementations and support for more than one C2C protocol in the National Transportation Communications for ITS Protocol (NTCIP). This approach facilitates the exchange of messages through gateways connecting disparate systems. In addition, this layered approach will facilitate the migration to other protocols in the future as the telecommunications industry continues to advance its technology.

1.3 Approach

The structure of this standard, TMDD Version v3.03, follows a systems engineering process. A systems engineering process (SEP) is a structured way of thinking about and defining a system. The systems engineering process is an iterative approach to technical management, acquisition and supply, system design, product realization, and technical evaluation at each level of the system, beginning at the top (the system level) and propagating those processes through a series of steps which eventually lead to a preferred system solution. Figure 3 shows a representation of the systems engineering process called the VEE diagram. This general process has been customized for use for this standard – it follows the process steps on the left side of the VEE indicated by the oval in Figure 3.

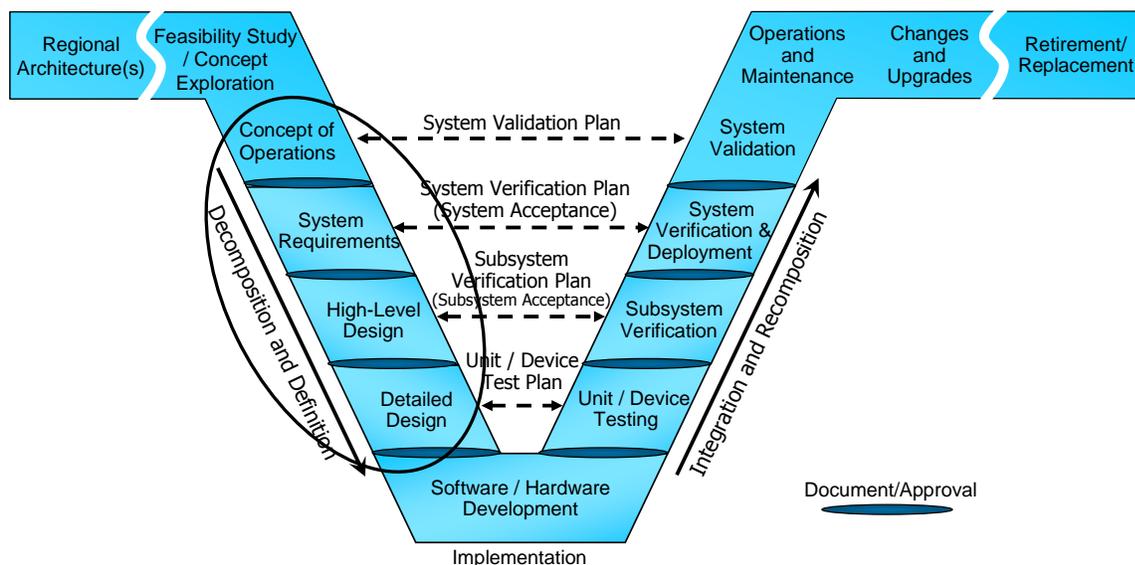

Figure 3 Systems Engineering Process “VEE” Diagram

Due to the nature of this standard, there is no software coding or hardware fabrication involved in the final outputs. Nor is there testing per se. This standard focuses on concept of operations (defined by user needs), system requirements (primarily functional requirements), and design (both aspects of high level and detailed design).

1.4 Document Purpose and Organization

The purpose of the *TMDD Volume II: Design Content* document is to identify and describe the design content, in terms of dialogs, message sets and data elements (data concepts), which satisfies the needs and fulfills the requirements for a traffic management center (TMC) to provide services to external centers (EC) via a systems interface.

These needs and requirements are identified and described in the companion volume *TMDD Volume I: Concept of Operations and Requirements*. TMDD Volume I also addresses topics surrounding the use of the standard such as:

- Terms and Definitions;
- Acronyms;
- References;
- Conformance to the standard;
- Extensions to the standard; and
- Backwards compatibility of this version of the standard with previous versions.

TMDD Volume II: Design Content is organized as follows.

- Section 1 of this document (Document Introduction) provides an introduction to the TMDD standard and describes the organization of the standard.
- Section 2 of this document (TMDD Interface Dialogs) identifies and describes the sequence of message exchanges needed for communications between a TMC and an EC.
- Section 3 of this document (TMDD 14817 and XML Definitions of Data Concepts) provides a highly structured definition of the TMDD data concepts that fulfill the TMDD requirements.
- Section 4 of this document is the Requirements Traceability Matrix (RTM), which provides a table documenting the data concepts that fulfill each requirements defined in Volume I.

2 TMDD Interface Dialogs and Messages

2.1 Normative

Section 2.1, sections 2.4 through 2.7 and sections 3.1 through 3.6 of Volume II are normative.

2.1.1 TMDD Electronic Design Files

The electronic design files of the TMDD are normative to the standard. These electronic design files contain the source design of the TMDD used in developing Volume II. These electronic files have been verified using software tools to be correct ASN.1, WSDL and XML Schema syntax.

A description of each TMDD electronic design file is included below:

File	Format	Description	md5sum
ISO14817M1.asn	ASN.1	Contains the ISO 14817 meta attribute schema.	f70c900ddcee49055470f7b8174a99da
TMDDM1.asn	ASN.1	Contains the ISO 14817 meta attributes for TMDD object class data concepts.	3d9a80ac8a20bb5961d3dc7334ee0f14
TMDDM4.asn	ASN.1	Contains the ISO 14817 meta attributes for TMDD message, data frame, and data element data concepts.	9d51cd9aadf125e5e62247d598bfa5e6
TMDDM5.asn	ASN.1	Contains the ISO 14817 meta attributes for dialog data concepts.	8260445a1649eb5852899023e4c8e2fd
TMDD.asn	ASN.1	Contains the ASN.1 definitions of TMDD messages, data frames, and data elements. This file contains the ASN.1 definitions used in the DATA-TYPE meta attribute of the tmdd-iso14817-m4.asn file	5fc3af7c407174039ce2af3ad4bab3e0
TMDD.xsd	XML Schema	Contains the XML Schema definitions of TMDD messages, data frames, and data elements.	59264a06b8d9a350ad871dfac3c2361
TMDD.wsdl	WSDL	Contains the WSDL definitions of TMDD dialogs.	b67b0b694fc032773c249fb692d46c63

Table 1 Normative TMDD Electronic Design Files

The md5sum is a check sum that may be used by an implementor to verify that they have acquired the same TMDD electronic design files as used by Volume II.

2.1.2 TMDD Support Electronic Design Files

Several additional electronic design files are also included with the TMDD electronic design files. These support files are not part of the TMDD standard, but rather represent design elements that are defined in other (normative) standards referenced by this TMDD standard. These support files are provided to complete and validate the TMDD standard. If there are any discrepancies between these provided electronic design support files and the normative referenced standard, the normative referenced standard shall take precedence.

A description of each electronic design support file is included below:

File	Format	Description	md5sum
ATIS.asn	ASN.1	Contains the ASN.1 definitions of the J2354 - Message Set for Advanced Traveler Information Systems data elements referenced by TMDD.	393b8d4d34111c61f0edd49ccacfb1fe
ATIS.xsd	XML Schema	Contains the XML Schema definitions of the J2354 - Message Set for Advanced Traveler Information Systems data elements referenced by TMDD.	350b47c28f42b356715a50c376e655e0

File	Format	Description	md5sum
C2C.asn	ASN.1	Contains the ASN.1 definitions of the NTCIP 2306, Application Profile for XML Message Encoding and Transport in ITS Center-to-Center Communications, design elements (dialogs, messages, data frames, data elements) referenced by TMDD.	61e75d6dca25b7772b7889a20e36ce15
C2C.xsd	XML Schema	Contains the XML Schema definitions of the NTCIP 2306, Application Profile for XML Message Encoding and Transport in ITS Center-to-Center Communications, design elements (dialogs, messages, data frames, data elements) referenced by TMDD.	5e2be5b71c47e93764d39bad250e6fd1
ITIS.asn	ASN.1	Contains the ASN.1 definitions of the SAE J2540-2, ITIS Phrase Lists design elements (data frames, data elements) referenced by TMDD.	6d28e0fe82504ba20dcc6ef213482a6c
ITIS-Adopted-03-00-02.xsd	XML Schema	Contains the XML Schema definitions of the SAE J2540-2, ITIS Phrase Lists design elements (data frames, data elements) referenced by TMDD.	ad42824aba4f1122b59c928ba69d19e5
ITIS-Local-03-00-02.xsd	XML Schema	Contains the local extensions for SAE J2540-2, ITIS Phrase Lists.	63040b4978e6563d6265807411a456b5
LRMS.asn	ASN.1	Contains the ASN.1 definitions of the SAE J2266, Location Referencing Message Specification (LRMS) design elements (data frames, data elements) referenced by TMDD.	99c3911691d71080b8a6c80518ecd6ac
LRMS-Adopted-02-00-00.xsd	XML Schema	Contains the XML Schema definitions of the SAE J2266, Location Referencing Message Specification (LRMS) design elements (data frames, data elements) referenced by TMDD.	2b1c34de8f26dd97dd79a26caced9609
LRMS-Local-02-00-00.xsd	XML Schema	Contains the local extensions for SAE J2266, Location Referencing Message Specification (LRMS).	66026cdb369c5c941a84646370261642
NTCIP.asn	ASN.1	Contains the ASN.1 definitions of the NTCIP 1200-series data objects (elements) referenced by TMDD.	8685f8590b4e238d2f7bd725363c9335
NTCIP-References.xsd	XML Schema	Contains the XML Schema definitions of NTCIP 1200-series data objects (elements) referenced by TMDD.	7cb66d84428774dd9960005f46919719

Table 2 Normative TMDD Support Electronic Design Files

2.1.3 TMDD ISO 14817 and ASN.1

ISO 14817 is a standard that describes the meta attributes of data concepts defined in a data dictionary, such as the TMDD. Volume II presents ASN.1 fragments of data concepts for: dialogs, messages, data frames, data elements and object classes. These fragments use namespace prefixes, such as “NTCIP.” and “LRMS.”, that represent a shorthand for specific corresponding ASN.1 imports. These fragments also use OID prefixes, such as “phaseEntry” and “dmsMessageEntry”, that represent a shorthand for specific corresponding ASN.1 imports. All namespace and OID prefixes in the ASN.1 fragments left unspecified are completely specified in the normative TMDD-ISO14817-M1.asn, TMDD-ISO14817-M4.asn, TMDD-ISO14817-M5.asn and TMDD.asn files (see Volume II, Table 1).

Note that the ASN.1 modules that define the TMDD data concepts are copyrighted by AASHTO/ITE and thus cannot be changed.

2.1.4 TMDD WSDL and XML Schema

Volume II presents XML fragment representation of dialogs, messages, data frames and data elements. These fragments use XML namespace prefixes, such as “xs:” and “itis:”, that

represent a shorthand for specific corresponding URIs defined in the TMDD WSDL and XML Schema. All namespaces left unspecified in the XML fragments are completely specified in the normative TMDD.xsd and TMDD.wsdl files (see Volume II, Table 1).

Within the TMDD.wsdl file, the tns is a namespace called "this namespace". The namespace the WSDL uses for itself is defined in the tns, and is appropriately referred to as '../dialogs'. The TMDD.wsdl also references elements defined in other namespaces. The TMDD.wsdl references message names contained in the TMDD.xsd schema. The namespace is defined in the TMDD.xsd schema as '../messages'. The TMDD.wsdl must use this name in referencing the TMDD messages. The NTCIP 2306 C2C group gave the name '../c2c-message-administration' to the C2C schema elements. The TMDD.wsdl must use this name to reference the elements used to define messages for publication and subscription dialogs.

Note that the TMDD XML Schema and WSDL that define the TMDD data concepts are copyrighted by AASHTO/ITE and thus cannot be changed.

Note: The location attributes of the service descriptions are used to supply the actual URL that needs to be contacted to use the service. In actual practice, each center would customize this file to include the correct URLs for the services it provides. Therefore, the location URLs given in this file are dummy values, used for illustrative purposes only.

2.2 Tutorial

2.2.1 What is a Dialog?

A dialog describes a sequence of message exchanges. For example, a request-response dialog would include two messages being shared between an external center (EC) and owner center to accomplish information sharing. The first message would include the request for information, followed by a message containing the information (response). Some dialogs are simple and include one or two exchanges, while complex dialogs would include a larger number of steps and alterations of sequence steps based on some criteria (for example, special error handling).

Dialogs can be described using the Unified Modeling Language (UML) Sequence Diagrams. This is consistent with the ISO 14817 standard, which is being used by TMDD as the guide-spec for defining TMDD data concepts. A conceptual UML Sequence Diagram is shown below to illustrate relevant portions. The diagram shows examples of several types of "calls," not all of which are employed in the actual dialogs defined later in the section.

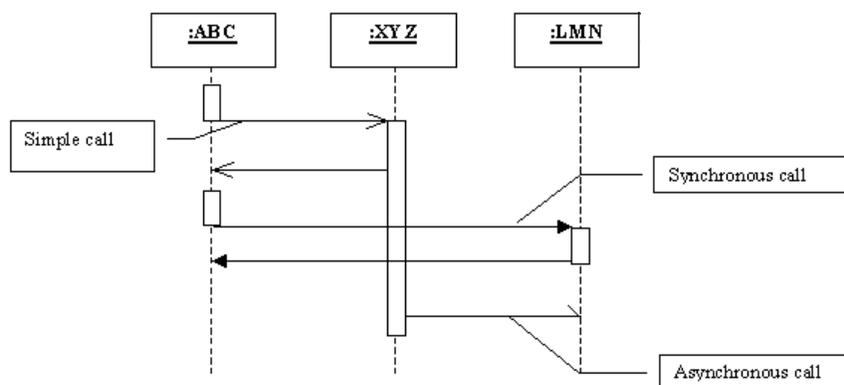

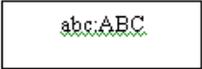

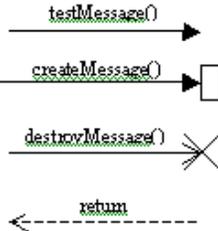

Figure 4 Parts of a UML Sequence Diagram

UML Sequence Diagram Element and Description	Symbol
<p>Object: The primary element sequence diagram is an object—an instance of a class. A sequence diagram consists of sequences of interaction among different objects over a period of time. An object is represented by a named rectangle. The name to the left of the ":" is the object name and to its right is the class name.</p>	
<p>Message: The interaction between different objects in a sequence diagram is represented as messages. A message is denoted by a directed arrow. Depending on the type of message, the notation differs. In a sequence diagram, you can represent simple messages, special messages to create or destroy objects and message responses. In this document only the top and bottom message types (as shown in the diagram) are used.</p>	

2.3 Defining the Dialog Sequence

2.3.1 Defining Message Patterns, Encoding and Transport

An information level standard, such as the TMDD, does not define the mechanism of encoding and transporting messages between centers—this is defined by Application Level Standards such as the Application Profiles NTCIP 2304 (AP-DATEX) and NTCIP 2306 (AP-C2CXML).

An informational level standard specifies the format and structure of message content and the sequence of message exchanges. The TMDD dialogs are information level dialogs, intended to be separate from the application level dialogs specified in the NTCIP 2304 and NTCIP 2306 standards. In this way, a TMDD-based solution can be developed with either the NTCIP 2304 or NTCIP 2306 at the application level.

The key application level standards, NTCIP 2304 and NTCIP 2306, are summarized below:

- **NTCIP 2304.** AP-DATEX (DATa EXchange) is both an NTCIP and ISO standard (ISO 14827) and defines the rules for message encoding and transport for ASN.1-based communications definitions.
- **NTCIP 2306.** AP-C2C XML is based on the rules of message encoding and transport of the W3C's (World Wide Web Consortium) Web Services Architecture. NTCIP 2306 provides a way to define messages, using the XML Schema, and dialogs, using the Web Services Definition Language (WSDL).

One additional standard is relevant to this discussion:

- **ISO 14817.** Provides a way to define data concepts: object classes, dialogs, messages, data frames and data elements.

2.3.2 NTCIP 2304 Overview

The NTCIP 2304 is formally entitled “Application Profile for DATEX-ASN (AP-DATEX).” NTCIP 2304 references the ISO 14827 standard that defines the rules for message exchanges, encoding and transport for ASN.1-based communications definitions. The NTCIP 2304 is based on the concept that two centers are always connected. Protocol level dialogs for connecting, logging in and disconnecting are defined and required. Once connected, two systems share information using a request-response message pattern or subscription-publication pattern.

2.3.3 NTCIP 2306 Overview

The NTCIP 2306 is formally entitled “Application Profile for XML Message Encoding and Transport in ITS Center-to-Center Communications.” The NTCIP-C2C XML provides a way to specify Web Services Definition Language (WSDL) for the following combinations of message transport:

- **XML over HTTP.**
- **SOAP over HTTP.**
- **XML over FTP.**

The TMDD.wsdl only addresses SOAP over HTTP at this time.

2.3.4 NTCIP 2304 and 2306 Message Patterns

Message patterns are the building blocks of dialogs. Simple dialogs can handle a wide variety of situations, or a project may define complex dialogs to meet its special project requirements. The basic building blocks of dialogs, or message patterns, are shown below:

- **Request-Response.** This message pattern supports the sending of a message followed by a response. This pattern implements a sequence of message communications.
- **Subscription-Publication.** This message pattern supports a subscriber application performing an initial request-response to set up future asynchronous publications from an information publisher application.

2.3.4.1 Specifying NTCIP 2304 Message Patterns

The NTCIP 2304 supports the TMDD request-response and subscription-publication message patterns and includes subscription types for: single, periodic and event-driven, corresponding to the TMDD single, periodic and event-driven subscription types. Note that NTCIP 2304 references clauses in ISO 148127-2 that allow further specification of the DATEX-ASN subscription modes.

2.3.4.2 Specifying NTCIP 2306 Message Patterns

The NTCIP 2306 supports the TMDD request-response and subscription-publication message patterns and includes subscription types for: oneTime, periodic and onChange, corresponding to the TMDD single, periodic and event-driven subscription types. Request-response message patterns are defined in Clause 7.1 of NTCIP 2306, while subscription-publication message patterns are defined in Clause 7.2 of NTCIP 2306. Note that NTCIP 2306 requires that the operation name, in this case the dialog, begin with the prefix “OP_” followed by a descriptive name for the operation. TMDD uses the prefix “DL_” to describe its operation. The subscription type is defined in Section 3.6.6.21, SubscriptionTypeItem, in this volume.

2.4 Generic TMDD Dialogs

Based on the overview presented above, TMDD will define several generic interface dialogs that include the following information:

- Description

- Sequence Diagram

The specific TMDD dialogs (discussed in Section 3.1) will reference one of the generic dialogs presented below.

Note that NTCIP 2306 requires that the operation name, in this case the dialog, begin with the prefix “OP_” followed by a descriptive name for the operation. TMDD uses the prefix “DL_” to describe its operation. In addition, TMDD uses the optional informationalText element defined in NTCIP 2306 (See NTCIP 2306:7.2.1.3:InformationalText), to return error messages, which are also called faults in this TMDD standard.

2.4.1 Generic Request-Response Dialog

2.4.1.1 Description

The request-response dialog supports the sending of an information or control message initiated by an external center followed by a response by the owner center upon request. Upon error, the owner center returns an error message.

2.4.1.2 Sequence Diagram

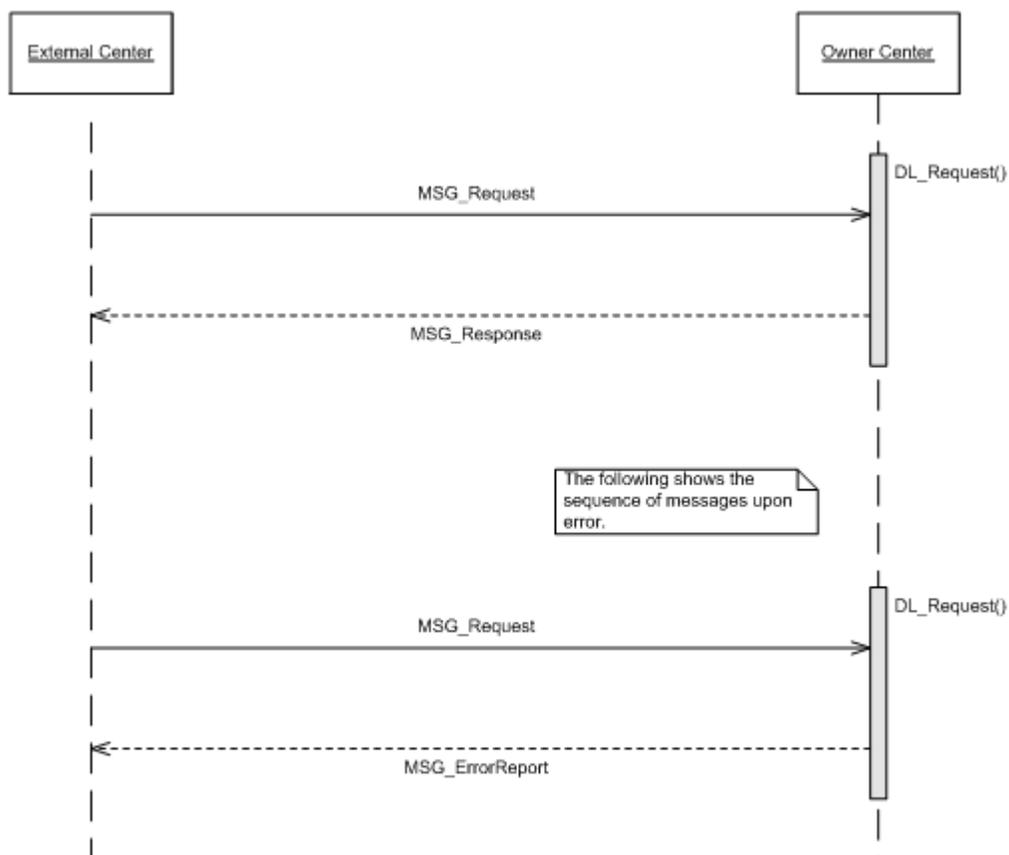

Figure 5 Generic Request-Response Dialog

2.4.2 Generic Subscription Dialog

2.4.2.1 Description

The subscription dialog, initiated by an EC and accepted by an OC, is mandatory for generation of information updates from an OC to an EC. Upon subscription for information updates by an EC, the OC shall provide a confirmation receipt. Upon error, the OC shall return an error message.

2.4.2.2 Sequence Diagram

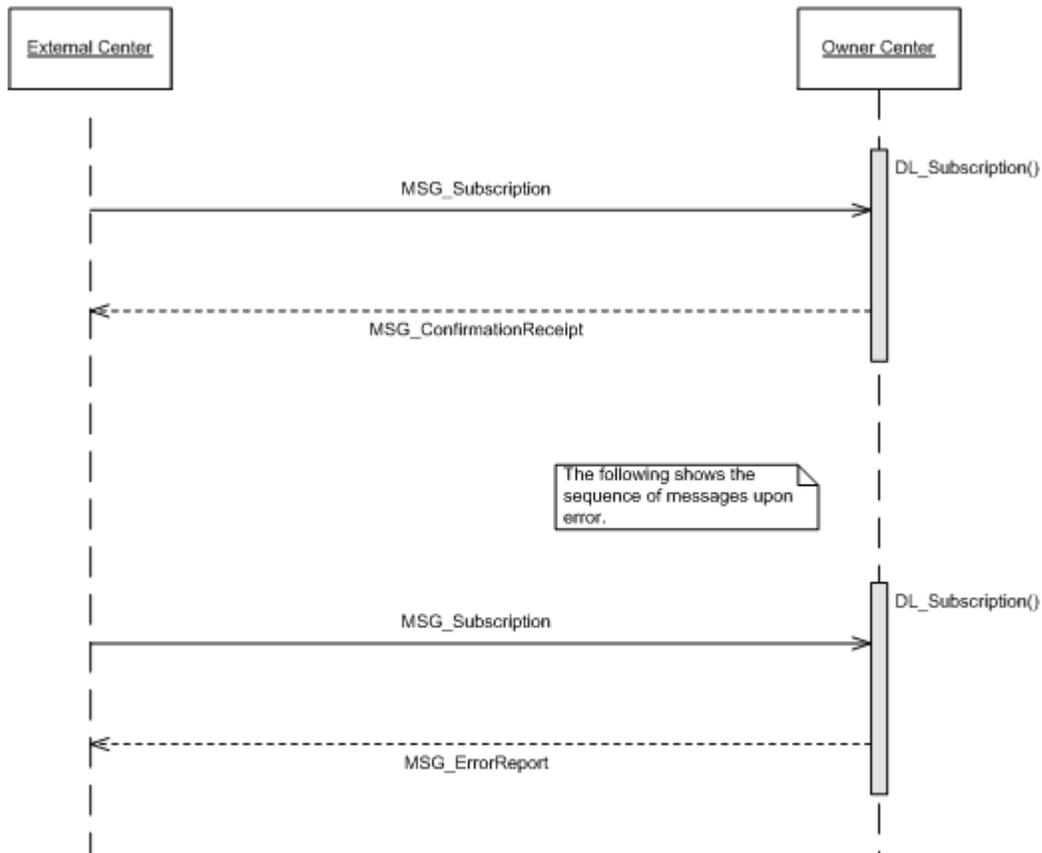

Figure 6 Generic Subscription Dialog

2.4.3 Generic Publication Update Dialog

2.4.3.1 Description

Upon acceptance of a subscription dialog, an OC shall provide information updates to an EC. Upon error, the EC shall return an error message.

2.4.3.2 Sequence Diagram

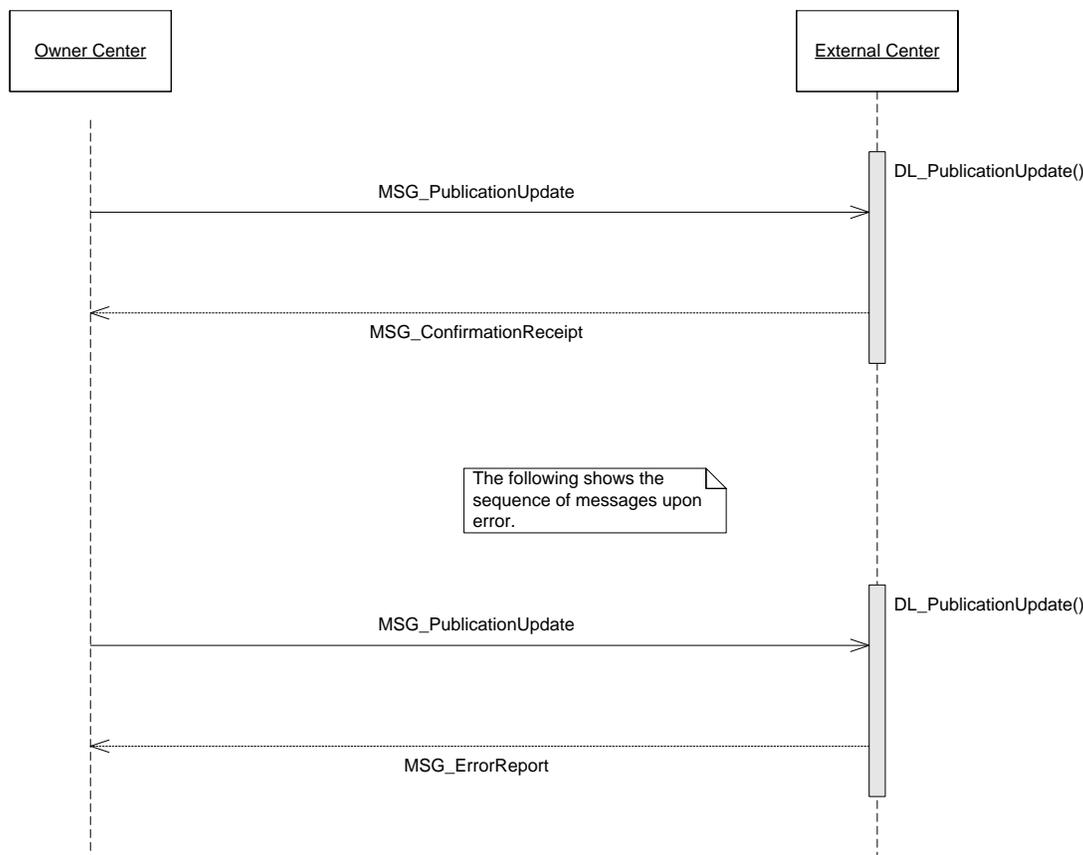

Figure 7 Generic Publication Update Dialog

2.5 Handling of Null Data Values

In defining the data content of messages in TMDD, some data elements are defined as mandatory, while others as optional. This section deals with a restriction on mandatory data elements – including those that are mandatory by the TMDD as well as those optional elements that have been deemed mandatory for a specific implementation – that do not have data available.

2.5.1 Handling of Null Data Values for Mandatory Data Elements

Mandatory data elements may not contain a null value (i.e., no data).

Therefore, if a center (whether owner center or external center) receives a message with null values, and is unable to process the message, the center shall respond with an errorReportMsg with the error-report-code set to 'missing-information-prevents-processing-message (3)'.

A center (whether owner center or external center) shall not respond with a message that contains null data. In this case, the center shall respond with an errorReportMsg with the error-report-code set to 'no-valid-data-available (8)'.

2.6 Handling TMDD Extensions

An implementation of the TMDD may add extensions by adding optional elements in one or more separate XML Schemas, WSDL, and/or ASN.1 modules, but not in the TMDD.xsd

schema, TMDD.wsdl, or TMDD ASN.1 module (which are both copyrighted by AASHTO/ITE). A similar concept applies to adding additional values to enumerations. Implementing an extension, however, results in new elements not being able to be checked during validation of a message (since any additional elements, by definition, are acceptable).

2.6.1 Extending Dialogs

Extensions may not modify the dialogs contained in the standard. Where necessary, new dialogs shall be added to support the extensions and such dialogs shall be documented in a manner which is consistent with this standard (See Volume II, Sections 2.3, 2.4 and 3.0). Add new dialogs in a separate WSDL file or ASN.1 module, but not in the TMDD WSDL or TMDD ASN.1 module (which are both copyrighted by AASHTO/ITE). For XML implementations, this entails adding <message>, <portType>, <operation> and <service> elements to the separate WSDL file.

New dialogs must meet the following requirements:

1. They must conform to NTCIP 2304 or NTCIP 2306.
2. They must support the Request-Response or Subscription-Publication message pattern
3. They must be documented in ISO 14817 ASN.1 and XML representation
4. The XML representation of the interface dialogs shall be WSDL (as defined in NTCIP 2306).

2.6.2 Extending Messages and Data Frames

2.6.2.1 ASN.1

ASN.1 has a built-in mechanism for extensibility that can be applied to the message and data frame content of TMDD; it is the ... (ellipses) keyword. The use of the ellipses keyword indicates that additional data frames and data elements are acceptable. An example of the use of the ellipses keyword is shown below.

```
ArchivedDataProcessingDocumentationMetadataRequest ::= SEQUENCE {  
    authentication Authentication,  
    organization-information OrganizationInformation,  
    ... }  
}
```

Adding this line to the end of each TMDD message and data frame in the ASN.1 description will allow any content that is located at the end of a message or data frame to be validated.

2.6.2.2 XML

The XML schema has a built-in mechanism for extensibility that can be applied to the message and data frame content of TMDD; it is the “xs:any” construct. The xs:any construct in full form will be added as the last element of each message and data frame. An example is shown below.

```
<xs:any namespace="##other" processContents="lax" minOccurs="0"/>
```

Adding this line to the end of each TMDD message and data frame in the XML schema will allow any XML content that is located at the end of a message or data frame to be valid. In addition, the line shows that: 1) a namespace must be defined that defines the new extended content; 2) the contents will not be validated; and 3) that the extension is optional (minOccurs="0").

2.6.3 Extending Enumerations

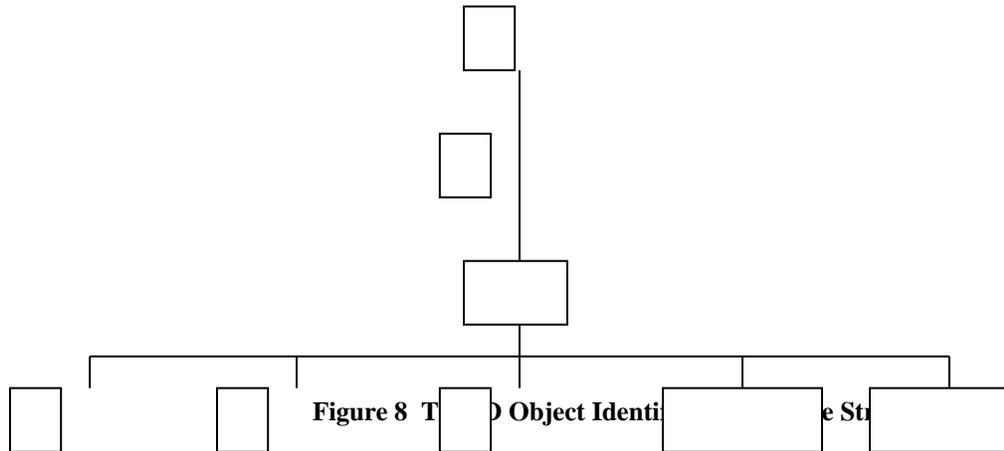

Where custom enumerated values are needed for a standardized data element, whether mandatory or optional, create a new data element with only the new enumerated values. When a custom enumerated value is needed for a mandatory data element in a standardized message or data frame, transmit the mandatory standardized data element with the value 'other', along with the new data element containing the extended enumeration value.

2.6.4 Extending Ranges

Where the range of a standardized data element needs to be extended, create a new data element with the extended range. Where the extended range is needed for a mandatory standardized data element in a standardized message or data frame, transmit the mandatory standardized data element with a value closest to the actual value along with the new data element with the extended range.

2.7 TMDD ASN.1 Object Identifiers

TMDD object identifiers (OID) are defined branching from the NEMA OID naming tree. This is defined in standard *NTCIP 8004 - Structure and Identification of Management Information (SMI) – version 02* and is illustrated in Figure 8 below.

The root node for TMDD (within the NEMA tree) is managed by the NTCIP coordinator. ITE/AASHTO are responsible for managing OID assignments of TMDD data concepts below TMDD root node. All of the data concepts defined in this document reside under the "tmdd" node.

The TMDD root node is: { iso (1) identified-organization (3) dod (6) internet (1) private (4) enterprise (1) nema (1206) transportation (4) tmdd (4) }. TMDD data concepts are further subdivided based on type. This is shown below with the OID representation next to the data concept type.

1. **Object Classes.** OID:{ tmddObjectClasses (1) }
2. **Data Elements.** OID:{ tmddDataElements (2) }
3. **Data Frames.** OID:{ tmddDataFrames (3) }
4. **Messages.** OID:{ tmddMessages (4) }
5. **Dialogs.** OID:{ tmddDialogs (5) }

3 TMDD ISO 14817 ASN.1 and XML Data Concept Definitions

This section contains the data concept definitions of TMDD for the following: object classes, dialogs, messages, data frames and data elements. The following apply:

1. The title used for each data concept clause is ASN.1 name.
2. With the exception of object classes, data concepts are organized by object class.
3. Each object class defined includes an ISO 14817 ASN.1 representation.
4. With the exception of object classes, each data concept defined includes the ISO 14817 ASN.1 and XML representation.
5. The XML representation of interface dialogs is that of WSDL (as defined in the NTCIP 2306).
6. The XML representation of messages, data frames and data elements are that of the XML Schema (as defined in SAE J2630).

Data concepts that refer to design elements in external standards are preceded by prefixes, such as "C2C." for ASN.1 representations and "NTCIP:" for XML representations.

3.6 External Data Entries

This section defines the structure of the external data concepts reused by this standard. The data concepts in this standard are divided into messages, data frames, and data elements. Messages are made up of content further defined in this document (i.e., made up of entries that are either atomic or complex but which are also defined in this document) and content defined externally to this document. Such external content is reused from other functional areas and standards developed by other groups and SDOs. The contents of this standard (both at the complete message level and its component parts) may be reused by other efforts elsewhere.

All text in this clause is considered normative. Definitions for this message set are presented in the following subclauses. If the definitions in the following subclauses conflict in any way with the definition in the external standard, the definition in the external standard shall take precedence.

The productions of ASN.1 which follow shall be considered normative in nature. While the majority of the normative content is reflected in the actual syntax of the ASN.1, some entries also have additional statements in the ASN.1 comments which shall be considered normative as well. In addition, the textual commentary provided with each entry (in sections marked "use" and "remarks") may also provide additional normative restrictions on the proper use of the entry being described. Users of this standard seeking to be in conformance with it shall follow the normative text outlined here.

3.6.1 CCTV Class Data Elements

3.6.1.1 rangePanLeftLimit

ASN-NAME "FontLineSpacing"
ASN-OBJECT-IDENTIFIER { fontEntry 6 }
DEFINITION "Indicates the default vertical spacing (in pixels) between each of
the lines within the font for Full Matrix VMS. The line spacing for a line is the
largest font line spacing of all fonts used on that line. The number of
pixels between adjacent lines is the average of the 2 line spacings of each line,
rounded up to the nearest whole pixel. Character Matrix VMS and Line Matrix VMS shall
ignore the value of this object; Full Matrix VMS shall subrange this object to the
range of zero (0) to the smaller of 255 or the value of vmsSignHeightPixels. See also
the MULTI tag 'new line [nl]'."
REMARKS ""

```

3.6.3.6 fontVersionID

3.6.3.6.1 ASN.1 REPRESENTATION

```
fontVersionID ITS-DATA-ELEMENT ::= {
DESCRIPTIVE-NAME "DMS.FontVersionID:id"
ASN-NAME "FontVersionID"
ASN-OBJECT-IDENTIFIER { fontEntry 7 }
DEFINITION      "Each font that has been downloaded to a sign shall have a relatively
unique ID. This ID shall be calculated using the CRC-16 algorithm defined in ISO 3309
and the associated OER-encoded (as defined in NTCIP 1102)
FontVersionByteStream.
The sign shall respond with the version ID value that is valid at the time.
FontVersionByteStream consists of the main font characteristics followed by n rows of
CharacterInfoList, as shown by the following ASN.1 construct:
FontVersionByteStream ::= SEQUENCE {
fontInformation FontInformation,
characterInfoList CharacterInfoList }
FontInformation describes the characteristics of the font which are common to each
character and defines the order in which this information appears when constructing
the byte stream which is used to calculate the CRC. There is only one row of data for
this SEQUENCE for a specific font, as defined by the following ASN.1 construct:
FontInformation ::= SEQUENCE {
fontNumber INTEGER (1..255),
fontHeight INTEGER (0..255),
fontCharSpacing INTEGER (0..255),
fontLineSpacing INTEGER (0..255) }
CharacterInfoList describes the characteristics of each defined character (e.g., where
characterWidth is greater than 0) for the fontNumber indicated within the
fontInformation field. The CharacterInformation is ordered by the characterNumber in
an increasing format per the following ASN.1 construct:
CharacterInfoList ::= SEQUENCE OF CharacterInformation
CharacterInformation describes the characteristics of a single character and defines
the objects and order of the objects within one row of CharacterInfoList, per the
following ASN.1 construct:
CharacterInformation SEQUENCE {
characterNumber INTEGER (1..65535),
characterWidth INTEGER (0..255),
characterBitmap OCTET STRING }
Complete definitions for these referenced objects are contained elsewhere in
this document.
The following is an example of developing the FontVersionByteStream value. Assume the
following values for this example, where we only have 2 characters defined:
fontNumber = 2,
fontHeight = 7,
fontCharSpacing = 1,
fontLineSpacing = 3,
characterWidth.52 = 7,
characterBitmap.52 = 1C 59 34 6F E1 83 00,
characterWidth.65 = 6,
characterBitmap.65 = 7B 3C FF CF 3C C0
The resulting string in hex would be:
FontVersionByteStream = 02 07 01 03 01 02 00 34 07 07 1C 59 34 6F E1 83 00 00 41 06 06
7B 3C FF CF 3C C0
CRC = 0x52ED
fontVersionID = 0xED52
Clarifications:
a) characterNumber is a two-byte unsigned integer.
b) characterBitmap is defined as OCTET STRING without a size constraint. (the length
octets shall be present)
c) CharacterInfoList is defined as SEQUENCE-OF that requires a quantity field
(unconstrained unsigned integer) `with a value equal to the number of times the
componentType is repeated within the value field'.
The resulting graphic depictions of those 2 defined characters are:
0001110
0010110
0100110
1000110
1111111
```

DEFINITION
    "This object defines a state machine allowing to manage fonts stored
    within a DMS. The definitions of the possible values are:
    notUsed (1) - a state indicating that this row in this table is currently not used.
    modifying (2) - a state indicating that the objects defined in this row can be
    modified.
    calculatingID (3) - a state indicating that the fontVersionID for this row is
    currently being calculated.
    readyForUse (4) - a state indicating that the font defined in this row can be used for
    message display.
    inUse (5) - a state indicating that the font defined in this row is currently being
    used for the displayed message.
    permanent (6) - a state indicating that the font defined in this row is a permanent
    font that cannot be modified. This font is provided by the sign vendor and can be used
    for message display.
    modifyReq (7) - command sent to request the transition to the modifying state..
    readyForUseReq (8) - command sent to request the transition to the readyForUse state.
    notUsedReq (9) - command sent to request the transition to the notUsed state.
    unmanagedReq (10) - command sent to request the transition to the unmanaged state.
    unmanaged (11) - a state indicating that the font defined in this row is a font that
    is not managed using the fontStatus object. This state can be use to manage the font
    as in NTCIP 1203 v1. Note: attempts to modify permanent fonts while in this state
    shall generate SNMP GenErr."

ASN-NAME "DmsColorScheme"
ASN-OBJECT-IDENTIFIER { multiCfg 11 }
```

DEFINITION "Indicates the color scheme supported by the DMS. The values are defined as:

monochrome1bit (1): - Only two states are available for each pixel: on (1) and off (0). A value of 'on(1)' shall indicate that the default foreground color is used and value of 'off(0)' shall indicate that the default background color is used.

monochrome8bit (2): - this color palette supports 256 shades ranging from 0 (off) to 255 (full intensity). Values between zero and 255 are scaled to the nearest intensity level supported by the VMS. Therefore, it is not required that a VMS have true 8-bit (256 shade) capabilities.

colorClassic (3): - as defined in Version 1 of NTCIP 1203, the following values are available:

black (0),
red (1),
yellow (2),
green(3),
cyan (4),
blue (5),
magenta (6),
white (7),
orange (8),
amber (9).

color24bit (4): - Each pixel is defined by three bytes, one each for red, green, and blue. Each color value ranges from 0 (off) to 255 (full intensity). The combination of the red, green, and blue colors equals the 16,777,216 number of colors. Each DMS must support the monochrome1bit scheme. The DMS may also optionally support one, but no more than one, of the other possible schemes. If the DMS supports only the monochrome1bit scheme, then that scheme is indicated. Otherwise, the other scheme is indicated."

dmsMessageMemoryType ITS-DATA-ELEMENT ::= {
    DESCRIPTIVE-NAME "DMS.DmsMessageMemoryType:cd"
    ASN-NAME "DmsMessageMemoryType"
    ASN-OBJECT-IDENTIFIER { dmsMessageEntry 1 }
    DEFINITION
        "Indicates the memory-type used to store a message. Also provides
        access to current message (currentBuffer) and currently scheduled message (schedule).
        The rows associated with the 'currentBuffer', 'schedule', and 'blank' message types
        cannot be written into, because these are either filled in by the controller
        (currentBuffer and schedule) or pre-defined and not modifiable (blank).
        The definitions of the enumerated values are:
        other - any other type of memory type that is not listed within one of the values
        below, refer to device manual;
        permanent - non-volatile and non-changeable;
        changeable - non-volatile and changeable;
        volatile - volatile and changeable;
        currentBuffer - contains the information regarding the currently displayed message
        (basically a copy of the message table row contents of the message that was
        successfully activated). Only one entry in the table can have the value of
        currentBuffer and the value of the dmsMessageNumber object shall be one (1). The
        content of the dmsMessageMultiString object shall be the currently displayed message
        (including a scheduled message), not the content of a failed message activation
        attempt;
        schedule - this entry contains information regarding the currently scheduled message
        as determined by the time-base scheduler (if present). Only one entry in the table can
        have the value of 'schedule' and the value of dmsMessageNumber for this entry shall be
        1. Displaying a message through this table row shall set the dmsMsgSourceMode object
        value to 'timebasedScheduler'. When no message is currently active based upon the
        schedule or if the schedule currently does not point to any message within the message
        table, the schedule entry shall contain a copy of dmsMessageMemoryType 7 (blank) with
        a dmsMessageNumber value of 1.
        blank - there shall be 255 (message numbers 1 through 255) pre-defined, static rows
        with this message type. These rows are defined so that message codes (e.g., objects
        with SYNTAX of either MessageIDCode or MessageActivationCode) can blank the sign at a
        stated run-time priority. The run-time priority of the blank message is equal to the
        message number (e.g., blank message number 1 has a run time priority of 1 and so on).
        The dmsMessageCRC for all messages of this type shall be 0x0000 and the
        dmsMessageMultiString shall be an OCTET STRING with a length of zero (0). The
        activation priority shall be determined from the activation priority of the
        MessageActivationCode."
    REMARKS ""
    DESCRIPTIVE-NAME-CONTEXT {""}
    DATA-CONCEPT-TYPE data-element

3.6.3.24.1 ASN.1 REPRESENTATION

```
dmsMessageTimeRemaining ITS-DATA-ELEMENT ::= {
DESCRIPTIVE-NAME "DMS.DmsMessageTimeRemaining:qty"
ASN-NAME "DmsMessageTimeRemaining"
ASN-OBJECT-IDENTIFIER { signControl 4 }
DEFINITION "Indicates the amount of remaining time in minutes that the current
message shall be active. The time shall be accurate to the nearest second and rounded
up to the next full minute. For example, a value of 2 shall indicate that the time
remaining is between 1 minute and 0.1 seconds and 2 minutes.
When a new message is activated with a minute-based duration, or this object is
directly SET, the minute-based duration value shall be multiplied by 60 to determine
the number of seconds that the message shall be active. Thus, if a message activation
is for 2 minutes, the DMS displays the message for 120 seconds.
The value 65535 indicates an infinite duration. A value of zero (0) shall indicate
that the current message display duration has expired.
A SET operation on this object shall allow a Central Computer to extend or shorten the
duration of the message. Setting this object to zero (0) shall result in the immediate
display of the dmsEndDurationMessage."

    ASN-NAME "AlternateRoute"
    ASN-OBJECT-IDENTIFIER { itisDataElements alternateRoute(1) }
    DEFINITION
        "The ITIS enumeration list commonly referred to as "Alternate Route,"
        is assigned the upper byte value of [33] (which provides for value ranges from 8448 to
        8703, inclusive). This list is formally called "AlternateRoute" in the ASN.1 and XML
        productions. The items in this enumeration list can be used as an event category
        classification. This list contains a total of 23 different phrases, divided into 2
        further sub-categories (the division into these sub-categories is informational only
        and other groupings may also be used). The remaining 104 values up to the lower byte
        value of [127] are reserved for additional "national" phrases in this byte range.
        Local phrases may be added to the list starting with the lower byte value of 128 and
        proceeding upward from there (in other words, the first value assigned for any local
        additions to this list would be given the value 8576)."

  DEFINITION "Vertical level specified as an ordinal class expressed positive  
  (above) or negative (below) the ground surface or ground level of a structure  
  (VerticalLevel = 0). For highway intersections or other transportation features, the  
  zero level is the ground surface level, whether or not traffic occurs on the ground  
  surface through the intersection or tunnel. For example, for bridges, the lowest  
  level of the bridge would be level +1 and, for tunnels, the highest level would be -1.  
  For parking structures or buildings, the zero level is that level called "ground" or  
  "main" or "lobby" or "first" floor, or otherwise most closely associated with the  
  surrounding ground surface. Note that for a building, the VerticalLevel may not  
  correspond to the official number of or label on a floor, but refers to the relative  
  level with respect to the zero level. This concept is useable in countries with  
  differing numbering conventions for building floors."

3.6.7.20 splitTime

3.6.7.20.1 ASN.1 REPRESENTATION

```
splitTime ITS-DATA-ELEMENT ::= {
DESCRIPTIVE-NAME "IntersectionSignal.SplitTime:qty"
ASN-NAME "SplitTime"
ASN-OBJECT-IDENTIFIER { splitEntry 3 }
```

DEFINITION "The time in seconds the splitPhase is allowed to receive (i.e. before a Force Off is applied) when constant demands exist on all phases. In floating coordForceMode, this is always the maximum time a non-coordinated phase is allowed to receive. In fixed coordForceMode, the actual allowed time may be longer if a previous phase gapped out. The splitTime includes all phase clearance times for the associated phase. The split time shall be longer than the sum of the phase minimum service requirements for the phase. When the time is NOT adequate to service the minimum service requirements of the phase, Free Mode shall be the result. The minimum requirements of a phase with a not-actuated ped include Minimum Green, Walk, Pedestrian Clear, Yellow Clearance, and Red Clearance; the minimum requirements of a phase with an actuated pedestrian include Minimum Green, Yellow Clearance, and RedClearance.

If the cycleTime entry of the associated patternTable entry is zero (i.e. the device is inFree Mode), then the value of this object shall be applied, if non-zero, as a maximum time for the associated phase.

If the critical path through the phase diagram is less than the cycleTime entry of the associated patternTable entry, all extra time is allotted to the coordination phase in each ring. If the critical path through the phase diagram is greater than the cycleTime entry of the associated patternTable entry (and the cycleTime is not zero) the device shall operate in the Free Mode.

While the Free Mode condition exists, the LocalOverride bit of shortAlarm shall be set to one (1)."

3.6.9.5 height

3.6.9.5.1 ASN.1 REPRESENTATION

```

height ITS-DATA-FRAME ::= {
    DESCRIPTIVE-NAME "Height:frame"
    ASN-NAME "Height"
    ASN-OBJECT-IDENTIFIER { lrmsDataFrames height(1) }
    DEFINITION          "A vertical height expressed as either an altitude with respect to a
    vertical datum, or a vertical level from -128 to +127, where level 0 is the ground
    surface, or ground level of a structure. For highway intersections of other
    transportation features, the zero level is the ground surface level, whether or not
    traffic occurs on the ground surface through the intersection or tunnel. For example,
    for bridges, the lowest level of the bridge would be level +1 and, for tunnels, the
    highest level would be -1. For parking structures or buildings, the zero level is
    that level called "ground" or "main" or "lobby" or "first" floor, or otherwise most
    closely associated with the surrounding ground surface. Note that for a building, the
    VerticalLevel may not correspond to the official number of or label on a floor, but
    refers to the relative level with respect to the zero level. This concept is useable
    in countries with differing numbering conventions for building floors."

4 Requirements Traceability Matrix

The Requirements Traceability Matrix (RTM), presented in Table 1, maps the requirements in *Volume I: Concept of Operations & Requirements* Section 3 to the solution elements defined in *Volume II: Design Content*. The matrix table can be used by:

- A specification writer to indicate what design content are to be implemented in a project specification;
- The protocol implementer, as a checklist to reduce the risk of failure to conform to the project specification;
- The supplier and user, as a detailed indication of the data concepts to be included in an implementation; and
- The user, as a basis for initially checking the potential interoperability with another implementation.

4.1.1 Requirement ID and Requirement Title Columns

The requirements are defined within Volume I, Section 3. The Req. ID (Vol. I) and Requirement Columns reference the requirements that are fulfilled by the data concepts represented in the Volume II: Design Content.

4.1.2 Dialog Column

This column indicates the name of the dialog and represents the highest level information element defined in Volume II. A hierarchy of dialog to message to data frame to data element can be followed in the RTM starting from the initial requirement-to-dialog starting point. The information in the Dialog column references Section 2 of Volume II that describes a generic dialog and provides a sequence diagram showing a message exchange sequence that fulfills the Volume I requirement.

4.1.3 Data Concept Name and Standard Clause Columns

The data concepts that fulfill a requirement are defined in Volume II. Some data concepts reference an external standard (for example, SAE LRMS or SAE ITIS) and are represented in Section 3.6 of this Volume II for convenience. The DC Type (Data Concept) column shows the type of data concept: dialog, message, data frame, or data element. The DC ID (Vol. II) column references a clause in Volume II containing the definition of the data concept, while the Definition Class Name column defines the data type for the data concept. The Data Concept Instance Name column defines the (instance) name of the data concept that fulfills the requirement.

4.1.4 Reference Data Concept (Informative)

The Reference DC column defines the instance name, or if specified the data type, of the "parent" data frame(s) or message that this data concept appears in to fulfill the requirement. Because of how the data concepts are defined in this standard, the instance name of the "parent" data frame or message for a data concept to fulfill a requirement may be different depending if the implementation uses ASN.1 or XML. For those requirements, both instance names are provided, prefaced with ASN: for ASN.1 implementations and prefaced with XML: for XML implementations.

Table 3 Requirements Traceability Matrix (RTM)

Req ID (Vol. I)	Requirement	Dialog	DC Type	Definition Class Name	DC ID (Vol. II)	Data Concept Instance Name	Reference DC

² DeviceInventoryHeader is the data type (definition class name) being referenced. The instance name depends on the device inventory message being transmitted. For CCTVs, Dynamic Message Signs, Environmental Sensor Stations, Highway Advisory Radios, Lane Closure Gates, Lane Control Signals, Ramp Meters (Controller), Traffic Signal Controllers and Video Switches, the instance name is device-inventory-header. For Detector Stations, the instance name is detector-station-inventory-header, while for individual Traffic Detectors, the instance name is detector-inventory-header. For individual Environmental Sensors, the instance name is ess-sensor-inventory-header. For individual ramp meter lanes, the instance name is metered-lane-inventory-header.

3.3.5.1.4.2.1	Required Device Control Response Content		data-element	organization-resource-identifier	3.4.16.8	device-id	DeviceControlResponse ⁵

⁴ device-control-request-header is the instance name. The parent data concept that calls device-control-request-header will be the control request message for any one of the following devices: CCTVs, Dynamic Message Signs, Highway Advisory Radios, Lane Closure Gates, Lane Control Signals, Ramp Meters, Traffic Signal Controllers, or Video Switches.

⁵ DeviceControlResponse is the data type (definition class name) being referenced. The instance name depends on the device control response message being transmitted. Unless otherwise specified in this paragraph, the instance name is deviceControlResponseMsg. For User Need 2.3.5.10.4, Need to Control a Remote Traffic Signal Controller, the instance name is device-control-response-header

⁸ dmsMsgTableSource is an octet string defined in NTCIP 1203 v03 and consists of several data concepts. The portion of dmsMsgTableSource defined by dmsMessageCRC is not needed and should be set to 0 or ignored.

⁹ Requirement 3.3.5.5.7.4.2.2 previously traced to data-element dmsMessageMemoryType, 3.6.3.20, message-memory-type, but now traces to data-element dmsMsgTableSource, 3.6.3.18, message-number. dmsMsgTableSource, 3.6.3.18, message-number is a message ID code consisting of several data elements, including dmsMessageMemoryType, 3.6.3.20, and thus dmsMessageMemoryType, 3.6.3.20 is redundant. However, this trace is maintained for backwards compatibility.

¹⁰ Requirement 3.3.5.5.7.5.1 previously included a trace to data-element dmsMessageMemoryType, 3.6.3.20, message-memory-type, but now traces to data-element dmsMsgTableSource, 3.6.3.18, message-number. dmsMsgTableSource, 3.6.3.18, message-number is a message ID code consisting of several data elements, including dmsMessageMemoryType, 3.6.3.20, and thus dmsMessageMemoryType, 3.6.3.20 is redundant. However, this trace is maintained for backwards compatibility.
